

IND-PV-SOP-003 — EV & Powertrain Reporting Standards

Document ID: IND-PV-SOP-003 **Version:** 1.6 **Effective date:** 01-Apr-2022 **Last review:** 20-Jun-2026 **Owner:** Product Analytics / Electrification PMO **Audience:** Product Heads, Marketing, Sales Ops, Data Science, Executives **Related attributes:** engine_type, engine_capacity, make, model, car_type

1. Purpose

Standardise how **Electric, Hybrid, Petrol, and Diesel** sales are counted, labelled, and narrated so EV growth stories remain credible and comparable year over year.

2. Powertrain classification

`engine\_type` value — Business label — Notes

|---|---|---|

Electric — BEV / EV — Battery electric only

Hybrid — Hybrid (HEV/strong hybrid family in this extract) — Not counted inside EV share unless asked “electrified”

Petrol — ICE Petrol — Includes CNG siblings only if labelled separately later

Diesel — ICE Diesel — Declining share expected in passenger cars

2.1 EV share formula (certified)

EV share (%) = $\text{SUM}(\text{order_qty} \text{ WHERE engine_type} = \text{'Electric'}) / \text{NULLIF}(\text{SUM}(\text{order_qty}), 0) * 100$

- Default grain: year, then region or make.
- Do **not** use order count when the question says “share of sales volume”.
- “Electrified share” (if asked) = Electric + Hybrid units / total units. Always label explicitly.

2.2 Expected EV trajectory (India context for this dataset)

Year — Indicative EV order share (reference extract) — Narrative cue

|---|---|---|

2019 — ~0.5% — Nascent

2020 — ~1% — Still early despite COVID

2021–22 — ~2–4% — Early adoption

2023 — ~7% — Inflection

2024 — ~10% — Mainstream awareness

2025–26 — ~14–16% — Structural shift

Narratives should celebrate EV growth **and** remind leaders that ICE (especially Petrol SUV/hatch) still dominates absolute volume.

3. Engine capacity field rules

Powertrain — Meaning of `engine\_capacity` — Example

|---|---|---|

Petrol / Diesel / Hybrid — Engine displacement (litres) — 1.2, 1.5, 2.0

Electric — **Usable battery pack (kWh)** — 24.0, 40.5, 59.0, 72.6

3.1 Data-quality rule

- EV `engine\_capacity` must be > 0. Zero kWh is invalid and must not be used to imply “no engine”.
- Do **not** run financial IQR outlier logic on `engine\_capacity` — it is a catalogue attribute, not a revenue metric.
- Never average EV kWh with ICE litres in one KPI without separating powertrains.

4. OEM EV storytelling (aligned to catalogue)

High-visibility EV models in the reference catalogue include:

- Tata: Nexon EV, Punch EV, Tiago EV
- Mahindra: XUV400, BE 6
- Hyundai: Ioniq 5
- Kia: EV6
- MG: ZS EV, Comet EV

When ranking “top EV by volume”, filter `engine_type = 'Electric'` then rank by `SUM(order_qty)`.

ICE volume leaders (Maruti / Tata / Mahindra overall) must not be narrated as “losing” solely because EV share rises — check absolute units.

5. Executive Q&A; playbook

Question — Correct approach

|---|---|

“Are EVs taking off?” — Show EV share by year + absolute EV units; cite inflection post-2023

“Which brand leads EV?” — Filter Electric; rank makes by units; optionally revenue

“Is SUV EV demand higher?” — Cross `car\_type` × `engine\_type` on units

“What battery sizes sell?” — Among Electric only, distribute `engine\_capacity` (kWh)

6. Narrative standards

Approved phrasing:

> “EV share of units rose from under 1% in 2019–20 to mid-teens by 2025–26 in this extract, while Petrol remains the volume backbone.”

Avoid:

> “Everyone is buying EVs now” (absolute ICE units still larger). > Mixing kWh and litres in one average. > Treating Hybrid as EV without saying “electrified”.

7. Compliance

Any published EV KPI must state the formula (units-based vs orders-based). Chat / OKF-assisted answers should cite this SOP when discussing EV demand.
